Packages for matrices

Some packages very useful for mathematics and specifically for matrix computations are listed here below:

- mathtools which is mainly an upgrade of the very well-known amsmath package (the backbone for mathematics with LATEX),
- physics which provides the numcases command to number all lines of a system of equations.

Matrices: principle

Types of matrices

Matrices can be written by using a matrix-like environment inside a mathematical equation environment such as the ones presented in B100 tutorial.

Several types of matrices exist. They differ with the type of delimiters surrounding the matrix:

matrix	pmatrix	bmatrix	Bmatrix
X_{11} X_{12} X_{21} X_{22}	$\begin{pmatrix} x_{11} & x_{12} \ x_{21} & x_{22} \end{pmatrix}$ vmatrix	$\begin{bmatrix} x_{11} & x_{12} \\ x_{21} & x_{22} \end{bmatrix}$ Vmatrix	$ \begin{cases} x_{11} & x_{12} \\ x_{21} & x_{22} \end{cases} $
	$\begin{vmatrix} x_{11} & x_{12} \\ x_{21} & x_{22} \end{vmatrix}$	$\begin{vmatrix} x_{11} & x_{12} \\ x_{21} & x_{22} \end{vmatrix}$	

Matrices: principle

Alignment within the matrix

By default, numbers are centred in each column of a matrix:

$$\begin{pmatrix} 2 & -3 \\ 42 & 0 \end{pmatrix}$$

A starred version of each matrix environment offers an optional argument where the alignment can be provided through a letter: c for center, r for right and 1 for left. Example with right alignment:

$$\begin{pmatrix} 2 & -3 \\ 42 & 0 \end{pmatrix}$$

More facilities

Specific matrices (1)

Zero matrix: zeromatrix or the shorter zmat command. Examples:

$$\begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}$$

$$\begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

Identity matrix: identitymatrix or the shorter imat command. Examples:

$$\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\begin{vmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{vmatrix}$$

More facilities

Specific matrices (2)

Diagonal matrix: diagonalmatrix or the shorter dmat command.

Optional argument to fill spaces.

Examples:

$$\begin{pmatrix} a & & & \\ & b & & \\ & & c \end{pmatrix} \qquad \qquad \begin{pmatrix} 1 & & & \\ & 2 & & \\ & & 3 \end{pmatrix} \qquad \qquad \begin{pmatrix} 1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 3 \end{pmatrix}$$

Automatically filled matrix: xmatrix or the shorter xmat command. The starred version creates automatic indices.

Examples:

$$\begin{pmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \end{pmatrix} \qquad \begin{pmatrix} x_{11} & x_{12} & x_{13} \\ x_{21} & x_{22} & x_{23} \\ x_{31} & x_{32} & x_{33} \end{pmatrix} \qquad \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix}$$

More facilities

Combinations of patterns

Simple way: use one of the previous commands, then add the other elements above and/or below like in a "regular" matrix.

Examples:

$$\begin{pmatrix} 1 & 0 \\ 0 & 1 \\ a & b \end{pmatrix} \qquad \qquad \begin{pmatrix} a & b & c \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

Issue: impossible to add elements on the right or on the left of a submatrix generated with the *physics*' commands.

Matrix as a single element: matrixquantity or the shorter mqty command.

Example:

$$\begin{pmatrix} 1 & 0 & e \\ 0 & 1 & d \\ a & b & c \end{pmatrix}$$
